QUESTION 5. Solve
$$(2x+2)y^{(2)}-2y'=rac{1}{x}$$

QUESTION 6. Is there a solution to $(2x+2)y^{(2)}-2y'=0$, y(0)=1 and y'(-1)=1? If yes, find the solution. If not, does that contradict some of the results we studied? Explain.

QUESTION 7. A tank with capacity 20 liters contains 10 liters of water in which 20 grams of salt is dissolved. A mixture containing 1 gram of salt per liter is pumped into the tank at a rate 4 liters/min, the well-mixture solution is pumped out at rate 3 liters/min. Find the amount A(t) of salt in the tank at time t. What will be the amount of salt in the tank at the instant it overflows?

QUESTION 5. 20 points A tank initially contains 20 gallons of Fresh WATER (i.e. when t=0, amount of salt is zero). A mixture containing 0.5 bound of salt per gallon is poured into the tank at rate of 2 gallons per minute, while the mixture leaves the tank at rate 4 gallons per minute.

a) Find the amount of salt in the tank at any time t.

b) When will the tank be empty?

c) Find the concentration of the salt in the tank at t = 9.5 minutes.

$$Vo = 20 \text{ gallons} = V(0)$$
 $P(0)=0$
 $Cin = 0.5 \text{ pound/gallon}$ $P(0)=0$
 $P(0)=0$
 $P(0)=0$
 $P(0)=0$

a)
$$\frac{dA}{dt} = Rin \cdot Cin - Rout Cout$$

$$R' = 0.5(2) - \frac{A(t)}{20-2t} \cdot 4$$

$$= 1 \quad A' + A(t) \left(\frac{4}{20-2t}\right) = 1$$

$$V(t) = 20 + \left(Rin - Rout\right)t = 20-2t$$

$$Cout = \frac{A(t)}{V} = \frac{A(t)}{20-2t}$$

1st order linear:

$$\int \frac{u}{20-2t} dt \int \frac{2}{10-t} dt - 2 \ln |10-t|$$

$$t = e = e = e \quad (if t > 10)$$

$$t = (10-t)^{-2}$$

$$A = \frac{\int (10-t)^{-2} dt}{(10-t)^{-2}} = \frac{+ 1 (10-t)^{-1} + c}{(10-t)^{-2}} = (10-t) + c (10-t)^{2} = A(t).$$

b) when
$$V(t)=0$$
 0= 20-2t => 20=2t => t= 10 minutes.

At lowinuteC, the tank will be empty.
